Some discrete distributions

6.1. Examples: Bernoulli, binomial, Poisson, geometric distributions

> **Bernoulli distribution**
>
> A random variable X such that $\mathbb{P}(X = 1) = p$ and $\mathbb{P}(X = 0) = 1 - p$ is said to be a *Bernoulli random variable* with parameter p. Note $\mathbb{E}X = p$ and $\mathbb{E}X^2 = p$, so $\operatorname{Var} X = p - p^2 = p(1 - p)$.

We denote such a random variable by $X \sim \operatorname{Bern}(p)$.

> **Binomial distribution**
>
> A random variable X has a *binomial distribution* with parameters n and p if $\mathbb{P}(X = k) = \binom{n}{k}p^k(1 - p)^{n-k}$.

We denote such a random variable by $X \sim \operatorname{Binom}(n, p)$.

The number of successes in n Bernoulli trials is a binomial random variable. After some cumbersome calculations one can derive $\mathbb{E}X = np$. An easier way is to realize that if X is binomial, then $X = Y_1 + \cdots + Y_n$, where the Y_i are independent Bernoulli variables, so $\mathbb{E}X = \mathbb{E}Y_1 + \cdots + \mathbb{E}Y_n = np$.

We have not defined yet what it means for random variables to be independent, but here we mean that the events such as $(Y_i = 1)$ are independent.

> **Proposition 6.1**
>
> Suppose $X := Y_1 + \cdots + Y_n$, where $\{Y_i\}_{i=1}^n$ are independent Bernoulli random variables with parameter p, then
> $$\mathbb{E}X = np, \operatorname{Var} X = np(1 - p).$$

PROOF. First we use the definition of expectation to see that

$$\mathbb{E}X = \sum_{i=0}^n i \binom{n}{i} p^i(1 - p)^{n-i} = \sum_{i=1}^n i \binom{n}{i} p^i(1 - p)^{n-i}.$$

Then

$$\mathbb{E}X = \sum_{i=1}^{n} i \frac{n!}{i!(n-i)!} p^i (1-p)^{n-i}$$

$$= np \sum_{i=1}^{n} \frac{(n-1)!}{(i-1)!((n-1)-(i-1))!} p^{i-1} (1-p)^{(n-1)-(i-1)}$$

$$= np \sum_{i=0}^{n-1} \frac{(n-1)!}{i!((n-1)-i)!} p^i (1-p)^{(n-1)-i}$$

$$= np \sum_{i=0}^{n-1} \binom{n-1}{i} p^i (1-p)^{(n-1)-i} = np,$$

where we used the Binomial Theorem (Theorem 1.1).

To get the variance of X, we first observe that

$$\mathbb{E}X^2 = \sum_{i=1}^{n} \mathbb{E}Y_i^2 + \sum_{i \neq j} \mathbb{E}Y_i Y_j.$$

Now

$$\mathbb{E}Y_i Y_j = 1 \cdot \mathbb{P}(Y_i Y_j = 1) + 0 \cdot \mathbb{P}(Y_i Y_j = 0)$$

$$= \mathbb{P}(Y_i = 1, Y_j = 1) = \mathbb{P}(Y_i = 1)\mathbb{P}(Y_j = 1) = p^2$$

using independence of random variables $\{Y_i\}_{i=1}^{n}$. Expanding $(Y_1 + \cdots + Y_n)^2$ yields n^2 terms, of which n are of the form Y_k^2. So we have $n^2 - n$ terms of the form $Y_i Y_j$ with $i \neq j$. Hence

$$\text{Var}\, X = \mathbb{E}X^2 - (\mathbb{E}X)^2 = np + (n^2 - n)p^2 - (np)^2 = np(1-p).$$

$\square$

Later we will see that the variance of the sum of independent random variables is the sum of the variances, so we could quickly get $\text{Var}\, X = np(1-p)$. Alternatively, one can compute $\mathbb{E}(X^2) - \mathbb{E}X = \mathbb{E}(X(X-1))$ using binomial coefficients and derive the variance of X from that.

Poisson distribution

A random variable X has the *Poisson distribution* with parameter λ if

$$\mathbb{P}(X = i) = e^{-\lambda} \frac{\lambda^i}{i!}.$$

We denote such a random variable by $X \sim \text{Pois}(\lambda)$. Note that

$$\sum_{i=0}^{\infty} \lambda^i / i! = e^{\lambda},$$

so the probabilities add up to one.

Proposition 6.2

Suppose X is a Poisson random variable with parameter λ, then
$$\mathbb{E}X = \lambda,$$
$$\operatorname{Var} X = \lambda.$$

PROOF. We start with the expectation

$$\mathbb{E}X = \sum_{i=0}^{\infty} i e^{-\lambda} \frac{\lambda^i}{i!} = e^{-\lambda}\lambda \sum_{i=1}^{\infty} \frac{\lambda^{i-1}}{(i-1)!} = \lambda.$$

Similarly one can show that

$$\mathbb{E}(X^2) - \mathbb{E}X = \mathbb{E}X(X-1) = \sum_{i=0}^{\infty} i(i-1)e^{-\lambda}\frac{\lambda^i}{i!}$$
$$= \lambda^2 e^{-\lambda} \sum_{i=2}^{\infty} \frac{\lambda^{i-2}}{(i-2)!}$$
$$= \lambda^2,$$

so $\mathbb{E}X^2 = \mathbb{E}(X^2 - X) + EX = \lambda^2 + \lambda$, and hence $\operatorname{Var} X = \lambda$. $\square$

Example 6.1.   Suppose on average there are 5 homicides per month in a given city. What is the probability there will be at most 1 in a certain month?

Solution: If X is the number of homicides, we are given that $\mathbb{E}X = 5$. Since the expectation for a Poisson is λ, then $\lambda = 5$. Therefore $\mathbb{P}(X = 0) + \mathbb{P}(X = 1) = e^{-5} + 5e^{-5}$.

Example 6.2.   Suppose on average there is one large earthquake per year in California. What's the probability that next year there will be exactly 2 large earthquakes?

Solution: $\lambda = \mathbb{E}X = 1$, so $\mathbb{P}(X = 2) = e^{-1}(\frac{1}{2})$.

We have the following proposition connecting binomial and Poisson distributions.

Proposition 6.3 (Binomial approximation of Poisson distribution)

If X_n is a binomial random variable with parameters n and p_n and $np_n \to \lambda$, then $\mathbb{P}(X_n = i) \to \mathbb{P}(Y = i)$, where Y is Poisson with parameter λ.

> **6.1 (Approximation of Poisson by binomials)**
>
> Note that by setting
> $$p_n := \lambda/n \quad \text{for} \quad n > \lambda$$
> we can approximate the Poisson distribution with parameter λ by binomial distributions with parameters n and p_n.

This proposition shows that the Poisson distribution models binomials when the probability of a success is small. The number of misprints on a page, the number of automobile accidents, the number of people entering a store, etc. can all be modeled by a Poisson distribution.

PROOF. For simplicity, let us suppose that $\lambda = np_n$ for $n > \lambda$. In the general case we can use $\lambda_n = np_n \xrightarrow[n\to\infty]{} \lambda$. We write

$$\mathbb{P}(X_n = i) = \frac{n!}{i!(n-i)!}p_n^i(1-p_n)^{n-i}$$

$$= \frac{n(n-1)\cdots(n-i+1)}{i!}\left(\frac{\lambda}{n}\right)^i\left(1-\frac{\lambda}{n}\right)^{n-i}$$

$$= \frac{n(n-1)\cdots(n-i+1)}{n^i}\frac{\lambda^i}{i!}\frac{(1-\lambda/n)^n}{(1-\lambda/n)^i}.$$

Observe that the following three limits exist

$$\frac{n(n-1)\cdots(n-i+1)}{n^i} \xrightarrow[n\to\infty]{} 1,$$

$$(1-\lambda/n)^i \xrightarrow[n\to\infty]{} 1,$$

$$(1-\lambda/n)^n \xrightarrow[n\to\infty]{} e^{-\lambda},$$

which completes the proof. $\qquad\qquad\qquad\qquad\qquad\qquad\qquad\qquad\qquad\qquad\square$

In Section 2.2.3 we considered **discrete uniform distributions** with $\mathbb{P}(X = k) = \frac{1}{n}$ for $k = 1, 2, \ldots, n$. This is the distribution of the number showing on a die (with $n = 6$), for example.

> **Geometric distribution**
>
> A random variable X has the geometric distribution with parameter p, $0 < p < 1$, if
> $$\mathbb{P}(X = i) = (1-p)^{i-1}p \quad \text{for} \quad i = 1, 2, \ldots.$$

Using a geometric series sum formula we see that

$$\sum_{i=1}^{\infty}\mathbb{P}(X = i) = \sum_{i=1}^{\infty}(1-p)^{i-1}p = \frac{1}{1-(1-p)}p = 1.$$

In Bernoulli trials, if we let X be the first time we have a success, then X will be a geometric random variable. For example, if we toss a coin over and over and X is the first time we get a heads, then X will have a geometric distribution. To see this, to have the first success

occur on the kth trial, we have to have $k-1$ failures in the first $k-1$ trials and then a success. The probability of that is $(1-p)^{k-1}p$.

> **Proposition 6.4**
>
> If X is a geometric random variable with parameter p, $0 < p < 1$, then
>
> $$\mathbb{E}X = \frac{1}{p},$$
>
> $$\operatorname{Var}X = \frac{1-p}{p^2},$$
>
> $$F_X(k) = \mathbb{P}(X \leqslant k) = 1 - (1-p)^k.$$

PROOF. We will use

$$\frac{1}{(1-r)^2} = \sum_{n=0}^{\infty} nr^{n-1}$$

which we can show by differentiating the formula for geometric series $1/(1-r) = \sum_{n=0}^{\infty} r^n$. Then

$$\mathbb{E}X = \sum_{i=1}^{\infty} i \cdot \mathbb{P}(X=i) = \sum_{i=1}^{\infty} i \cdot (1-p)^{i-1}p = \frac{1}{(1-(1-p))^2} \cdot p = \frac{1}{p}.$$

Then the variance

$$\operatorname{Var}X = \mathbb{E}(X - \mathbb{E}X)^2 = \mathbb{E}\left(X - \frac{1}{p}\right)^2 = \sum_{i=1}^{\infty}\left(i - \frac{1}{p}\right)^2 \cdot \mathbb{P}(X=i)$$

To find the variance we will use another sum. First

$$\frac{r}{(1-r)^2} = \sum_{n=0}^{\infty} nr^n,$$

which we can differentiate to see that

$$\frac{1+r}{(1-r)^3} = \sum_{n=1}^{\infty} n^2 r^{n-1}.$$

Then

$$\mathbb{E}X^2 = \sum_{i=1}^{\infty} i^2 \cdot \mathbb{P}(X=i) = \sum_{i=1}^{\infty} i^2 \cdot (1-p)^{i-1}p = \frac{(1+(1-p))}{(1-(1-p))^3} \cdot p = \frac{2-p}{p^2}.$$

Thus

$$\operatorname{Var}X = \mathbb{E}X^2 - (\mathbb{E}X)^2 = \frac{2-p}{p^2} - \left(\frac{1}{p}\right)^2 = \frac{1-p}{p^2}.$$

The cumulative distribution function (CDF) can be found by using the geometric series sum formula

$$1 - F_X(k) = \mathbb{P}(X > k) = \sum_{i=k+1}^{\infty} \mathbb{P}(X = i) = \sum_{i=k+1}^{\infty} (1-p)^{i-1}p = \frac{(1-p)^k}{1-(1-p)}p = (1-p)^k.$$

$\square$

Negative binomial distribution

A random variable X has *negative binomial distribution* with parameters r and p if

$$\mathbb{P}(X = n) = \binom{n-1}{r-1}p^r(1-p)^{n-r}, \quad n = r, r+1, \dots.$$

A negative binomial represents the number of trials until r successes. To get the above formula, to have the rth success in the nth trial, we must exactly have $r-1$ successes in the first $n-1$ trials and then a success in the nth trial.

Hypergeometric distribution

A random variable X has hypergeometric distribution with parameters m, n and N if

$$\mathbb{P}(X = i) = \frac{\binom{m}{i}\binom{N-m}{n-i}}{\binom{N}{n}}.$$

This comes up in sampling without replacement: if there are N balls, of which m are one color and the other $N-m$ are another, and we choose n balls at random without replacement, then X represents the probability of having i balls of the first color.

Another model where the hypergeometric distribution comes up is the probability of a success changes on each draw, since each draw decreases the population, in other words, when we consider sampling without replacement from a finite population). Then N is the population size, m is the number of success states in the population, n is the number of draws, that is, quantity drawn in each trial, i is the number of observed successes.

6.2. Further examples and applications

6.2.1. Bernoulli and binomial random variables.

Example 6.3. A company prices its hurricane insurance using the following assumptions:

   (i) In any calendar year, there can be at most one hurricane.
   (ii) In any calendar year, the probability of a hurricane is 0.05.
   (iii) The numbers of hurricanes in different calendar years are mutually independent.

Using the company's assumptions, find the probability that there are fewer than 3 hurricanes in a 20-year period.

Solution: denote by X the number of hurricanes in a 20-year period. From the assumptions we see that $X \sim \text{Binom}\,(20, 0.05)$, therefore

$$\mathbb{P}\,(X < 3) = \mathbb{P}\,(X \leqslant 2)$$
$$= \binom{20}{0} (0.05)^0 (0.95)^{20} + \binom{20}{1} (0.05)^1 (0.95)^{19} + \binom{20}{2} (0.05)^2 (0.95)^{18}$$
$$= 0.9245.$$

Example 6.4. Phan has a 0.6 probability of making a free throw. Suppose each free throw is independent of the other. If he attempts 10 free throws, what is the probability that he makes at least 2 of them?

Solution: If $X \sim \text{Binom}\,(10, 0.6)$, then

$$\mathbb{P}\,(X \geqslant 2) = 1 - \mathbb{P}\,(X = 0) - \mathbb{P}\,(X = 1)$$
$$= 1 - \binom{10}{0} (0.6)^0 (0.4)^{10} - \binom{10}{1} (0.6)^1 (0.4)^9$$
$$= 0.998.$$

6.2.2. The Poisson distribution.
Recall that a Poisson distribution models well events that have a low probability and the number of trials is high. For example, the probability of a misprint is small and the number of words in a page is usually a relatively large number compared to the number of misprints.

(1) The number of misprints on a random page of a book.
(2) The number of people in community that survive to age 100.
(3) The number of telephone numbers that are dialed in an average day.
(4) The number of customers entering post office on an average day.

Example 6.5. Levi receives an average of two texts every 3 minutes. If we assume that the number of texts is Poisson distributed, what is the probability that he receives five or more texts in a 9-minute period?

Solution: Let X be the number of texts in a $9-$minute period. Then $\lambda = 3 \cdot 2 = 6$ and

$$\mathbb{P}\left(X \geqslant 5\right) = 1 - \mathbb{P}\left(X \leqslant 4\right)$$
$$= 1 - \sum_{n=0}^{4} \frac{6^n e^{-6}}{n!}$$
$$= 1 - 0.285 = 0.715.$$

Example 6.6. Let $X_1, ..., X_k$ be independent Poisson random variables, each with expectation λ. What is the distribution of the random variable $Y := X_1 + ... + X_k$?

Solution: The distribution of Y is Poisson with the expectation $\lambda = k\lambda$. To show this, we use Proposition 6.3 and (6.1) to choose $n = mk$ Bernoulli random variables with parameter $p_n = k\lambda_1/n = \lambda_1/m = \lambda/n$ to approximation the Poisson random variables. If we sum them all together, the limit as $n \to \infty$ gives us a Poisson distribution with expectation $\lim_{n\to\infty} np_n = \lambda$. However, we can re-arrange the same $n = mk$ Bernoulli random variables in k groups, each group having m Bernoulli random variables. Then the limit gives us the distribution of $X_1 + ... + X_k$. This argument can be made rigorous, but this is beyond the scope of this course. Note that we do not show that the we have convergence in distribution.

Example 6.7. Let $X_1, \ldots, X_k$ be independent Poisson random variables, each with expectation $\lambda_1, \ldots, \lambda_k$, respectively. What is the distribution of the random variable $Y = X_1 + ... + X_k$?

Solution: The distribution of Y is Poisson with expectation $\lambda = \lambda_1 + ... + \lambda_k$. To show this, we again use Proposition 6.3 and (6.1) with parameter $p_n = \lambda/n$. If n is large, we can separate these n Bernoulli random variables in k groups, each having $n_i \approx \lambda_i n/\lambda$ Bernoulli random variables. The result follows if $\lim_{n\to\infty} n_i/n = \lambda_i$ for each $i = 1, ..., k$.

This entire set-up, which is quite common, involves what is called *independent identically distributed Bernoulli random variables* (i.i.d. Bernoulli r.v.).

Example 6.8. Can we use binomial approximation to find the mean and the variance of a Poisson random variable?

Solution: Yes, and this is really simple. Recall again from Proposition 6.3 and (6.1) that we can approximate Poisson Y with parameter λ by a binomial random variable $\text{Binom}\left(n, p_n\right)$, where $p_n = \lambda/n$. Each such a binomial random variable is a sum on n independent Bernoulli random variables with parameter p_n. Therefore

$$\mathbb{E}Y = \lim_{n\to\infty} np_n = \lim_{n\to\infty} n\frac{\lambda}{n} = \lambda,$$
$$\text{Var}(Y) = \lim_{n\to\infty} np_n(1 - p_n) = \lim_{n\to\infty} n\frac{\lambda}{n}\left(1 - \frac{\lambda}{n}\right) = \lambda.$$

6.2.3. Table of distributions. The following table summarizes the discrete distributions we have seen in this chapter. Here $\mathbb{N}$ stands for the set of positive integers, and $\mathbb{N}_0 = \mathbb{N} \cup \{0\}$ is the set of nonnegative integers.

Name	Notation	Parameters	PMF ($k \in \mathbb{N}_0$)	$\mathbb{E}[X]$	$\mathrm{Var}(X)$
Bernoulli	$\mathrm{Bern}(p)$	$p \in [0,1]$	$\binom{1}{k}p^k(1-p)^{1-k}$	p	$p(1-p)$
Binomial	$\mathrm{Binom}(n,p)$	$n \in \mathbb{N}$ $p \in [0,1]$	$\binom{n}{k}p^k(1-p)^{n-k}$	np	$np(1-p)$
Poisson	$\mathrm{Pois}(\lambda)$	$\lambda > 0$	$e^{-\lambda}\frac{\lambda^k}{k!}$	λ	λ
Geometric	$\mathrm{Geo}(p)$	$p \in (0,1)$	$\begin{cases} (1-p)^{k-1}p, & \text{for } k \geqslant 1, \\ 0, & \text{else.} \end{cases}$	$\frac{1}{p}$	$\frac{1-p}{p^2}$
Negative binomial	$\mathrm{NBin}(r,p)$	$r \in \mathbb{N}$ $p \in (0,1)$	$\begin{cases} \binom{k-1}{r-1}p^r(1-p)^{k-r}, & \text{if } k \geq r, \\ 0, & \text{else.} \end{cases}$	$\frac{r}{p}$	$\frac{r(1-p)}{p^2}$
Hyper-geometric	$\mathrm{Hyp}(N,m,n)$	$N \in \mathbb{N}_0$ $n, m \in \mathbb{N}_0$	$\frac{\binom{m}{k}\binom{N-m}{n-k}}{\binom{N}{n}}$	$\frac{nm}{N}$	$\frac{nm(N-n)}{N(N-1)}\left(1-\frac{m}{N}\right)$

6.3. Exercises

Exercise 6.1.   A UConn student claims that she can distinguish Dairy Bar ice cream from Friendly's ice cream. As a test, she is given ten samples of ice cream (each sample is either from the Dairy Bar or Friendly's) and asked to identify each one. She is right eight times. What is the probability that she would be right exactly eight times if she guessed randomly for each sample?

Exercise 6.2.   A Pharmaceutical company conducted a study on a new drug that is supposed to treat patients suffering from a certain disease. The study concluded that the drug did not help 25% of those who participated in the study. What is the probability that of 6 randomly selected patients, 4 will recover?

Exercise 6.3.   20% of all students are left-handed. A class of size 20 meets in a room with 18 right-handed desks and 5 left-handed desks. What is the probability that every student will have a suitable desk?

Exercise 6.4.   A ball is drawn from an urn containing 4 blue and 5 red balls. After the ball is drawn, it is replaced and another ball is drawn. Suppose this process is done 7 times.

(a) What is the probability that exactly 2 red balls were drawn in the 7 draws?
(b) What is the probability that at least 3 blue balls were drawn in the 7 draws?

Exercise 6.5.   The expected number of typos on a page of the new Harry Potter book is 0.2. What is the probability that the next page you read contains

(a) 0 typos?
(b) 2 or more typos?
(c) Explain what assumptions you used.

Exercise 6.6.   The monthly average number of car crashes in Storrs, CT is 3.5. What is the probability that there will be

(a) at least 2 accidents in the next month?
(b) at most 1 accident in the next month?
(c) Explain what assumptions you used.

Exercise 6.7.   Suppose that, some time in a distant future, the average number of burglaries in New York City in a week is 2.2. Approximate the probability that there will be

(a) no burglaries in the next week;
(b) at least 2 burglaries in the next week.

Exercise 6.8.   The number of accidents per working week in a particular shipyard is Poisson distributed with mean 0.5. Find the probability that:

(a) In a particular week there will be at least 2 accidents.

(b) In a particular two week period there will be exactly 5 accidents.

(c) In a particular month (i.e. 4 week period) there will be exactly 2 accidents.

Exercise 6.9. Jennifer is baking cookies. She mixes 400 raisins and 600 chocolate chips into her cookie dough and ends up with 500 cookies.

(a) Find the probability that a randomly picked cookie will have three raisins in it.

(b) Find the probability that a randomly picked cookie will have at least one chocolate chip in it.

(c) Find the probability that a randomly picked cookie will have no more than two bits in it (a bit is either a raisin or a chocolate chip).

Exercise 6.10. A roulette wheel has 38 numbers on it: the numbers 0 through 36 and a 00. Suppose that Lauren always bets that the outcome will be a number between 1 and 18 (including 1 and 18).

(a) What is the probability that Lauren will lose her first 6 bets.

(b) What is the probability that Lauren will first win on her sixth bet?

Exercise 6.11. In the US, albinism occurs in about one in 17,000 births. Estimate the probabilities no albino person, of at least one, or more than one albino at a football game with 5,000 attendants. Use the Poisson approximation to the binomial to estimate the probability.

Exercise 6.12. An egg carton contains 20 eggs, of which 3 have a double yolk. To make a pancake, 5 eggs from the carton are picked at random. What is the probability that at least 2 of them have a double yolk?

Exercise 6.13. Around 30,000 couples married this year in CT. Approximate the probability that at least in one of these couples

(a) both partners have birthday on January 1st.

(b) both partners celebrate birthday in the same month.

Exercise 6.14. A telecommunications company has discovered that users are three times as likely to make two-minute calls as to make four-minute calls. The length of a typical call (in minutes) has a Poisson distribution. Find the expected length (in minutes) of a typical call.

6.4. Selected solutions

Solution to Exercise 6.1:   This should be modeled using a binomial random variable X, since there is a sequence of trials with the same probability of success in each one. If she guesses randomly for each sample, the probability that she will be right each time is $\frac{1}{2}$. Therefore,

$$\mathbb{P}\left(X = 8\right) = \binom{10}{8} \left(\frac{1}{2}\right)^8 \left(\frac{1}{2}\right)^2 = \frac{45}{2^{10}}.$$

Solution to Exercise 6.2: $\binom{6}{4} (0.75)^4 (0.25)^2$

Solution to Exercise 6.3:   For each student to have the kind of desk he or she prefers, there must be no more than 18 right-handed students and no more than 5 left-handed students, so the number of left-handed students must be between 2 and 5 (inclusive). This means that we want the probability that there will be 2, 3, 4, or 5 left-handed students. We use the binomial distribution and get

$$\sum_{i=2}^{5} \binom{20}{i} \left(\frac{1}{5}\right)^i \left(\frac{4}{5}\right)^{20-i}.$$

Solution to Exercise 6.4(A):

$$\binom{7}{2} \left(\frac{5}{9}\right)^2 \left(\frac{4}{9}\right)^5$$

Solution to Exercise 6.4(B):

$$\mathbb{P}\left(X \geqslant 3\right) = 1 - \mathbb{P}\left(X \leqslant 2\right)$$
$$= 1 - \binom{7}{0} \left(\frac{4}{9}\right)^0 \left(\frac{5}{9}\right)^7 - \binom{7}{1} \left(\frac{4}{9}\right)^1 \left(\frac{5}{9}\right)^6 - \binom{7}{2} \left(\frac{4}{9}\right)^2 \left(\frac{5}{9}\right)^5$$

Solution to Exercise 6.5(A): $e^{-0.2}$

Solution to Exercise 6.5(B): $1 - e^{-0.2} - 0.2e^{-0.2} = 1 - 1.2e^{-0.2}$.

Solution to Exercise 6.5(C): Since each word has a small probability of being a typo, the number of typos should be approximately Poisson distributed.

Solution to Exercise 6.6(A): $1 - e^{-3.5} - 3.5e^{-3.5} = 1 - 4.5e^{-3.5}$

Solution to Exercise 6.6(B): $4.5e^{-3.5}$

Solution to Exercise 6.6(C): Since each accident has a small probability it seems reasonable to suppose that the number of car accidents is approximately Poisson distributed.

Solution to Exercise 6.7(A): $e^{-2.2}$

Solution to Exercise 6.7(B): $1 - e^{-2.2} - 2.2e^{-2.2} = 1 - 3.2e^{-2.2}$.

Solution to Exercise 6.8(A): We have

$$\mathbb{P}\left(X \geqslant 2\right) = 1 - \mathbb{P}\left(X \leqslant 1\right) = 1 - e^{-0.5}\frac{(0.5)^0}{0!} - e^{-0.5}\frac{(0.5)^1}{1!}.$$

Solution to Exercise 6.8(B): In two weeks the average number of accidents will be $\lambda = 0.5 + 0.5 = 1$. Then $\mathbb{P}\left(X = 5\right) = e^{-1}\frac{1^5}{5!}$.

Solution to Exercise 6.8(C): In a 4 week period the average number of accidents will be $\lambda = 4 \cdot (0.5) = 2$. Then $\mathbb{P}\left(X = 2\right) = e^{-2}\frac{2^2}{2!}$.

Solution to Exercise 6.9(A): This calls for a Poisson random variable R. The average number of raisins per cookie is 0.8, so we take this as our λ. We are asking for $\mathbb{P}(R = 3)$, which is $e^{-0.8}\frac{(0.8)^3}{3!} \approx 0.0383$.

Solution to Exercise 6.9(B): This calls for a Poisson random variable C. The average number of chocolate chips per cookie is 1.2, so we take this as our λ. We are asking for $\mathbb{P}\left(C \geqslant 1\right)$, which is $1 - \mathbb{P}\left(C = 0\right) = 1 - e^{-1.2}\frac{(1.2)^0}{0!} \approx 0.6988$.

Solution to Exercise 6.9(C): This calls for a Poisson random variable B. The average number of bits per cookie is $0.8 + 1.2 = 2$, so we take this as our λ. We are asking for $\mathbb{P}\left(B \leqslant 2\right)$, which is $\mathbb{P}\left(B = 0\right) + \mathbb{P}\left(B = 1\right) + \mathbb{P}\left(B = 2\right) = e^{-2}\frac{2^0}{0!} + e^{-2}\frac{2^1}{1!} + e^{-2}\frac{2^2}{2!} \approx .6767$.

Solution to Exercise 6.10(A): $\left(1 - \frac{18}{38}\right)^6$

Solution to Exercise 6.10(B): $\left(1 - \frac{18}{38}\right)^5 \frac{18}{38}$

Solution to Exercise 6.11 Let X denote the number of albinos at the game. We have that $X \sim \mathrm{Binom}(5000, p)$ with $p = 1/17000 \approx 0.00029$. The binomial distribution gives us

$$\mathbb{P}(X = 0) = \left(\frac{16999}{17000}\right)^{5000} \approx 0.745 \qquad \mathbb{P}(X \geqslant 1) = 1 - \mathbb{P}(X = 0) = 1 - \left(\frac{16999}{17000}\right)^{5000} \approx 0.255$$

$$\mathbb{P}(X > 1) = \mathbb{P}(X \geqslant 1) - \mathbb{P}(X = 1) =$$

$$= 1 - \left(\frac{16999}{17000}\right)^{5000} - \binom{5000}{1}\left(\frac{16999}{17000}\right)^{4999}\left(\frac{1}{17000}\right)^1 \approx 0.035633$$

Approximating the distribution of X by a Poisson with parameter $\lambda = \frac{5000}{17000} = \frac{5}{17}$ gives

$$\mathbb{P}(Y = 0) = \exp\left(-\frac{5}{17}\right) \approx 0.745 \qquad \mathbb{P}(Y \geqslant 1) = 1 - \mathbb{P}(Y = 0) = 1 - \exp\left(-\frac{5}{17}\right) \approx 0.255$$

$$\mathbb{P}(Y > 1) = \mathbb{P}(Y \geqslant 1) - \mathbb{P}(Y = 1) = 1 - \exp\left(-\frac{5}{17}\right) - \exp\left(-\frac{5}{17}\right)\frac{5}{17} \approx 0.035638$$

Solution to Exercise 6.12: Let X be the random variable that denotes the number of eggs with double yolk in the set of chosen 5. Then $X \sim \mathrm{Hyp}(20, 3, 5)$ and we have that

$$\mathbb{P}(X \geqslant 2) = \mathbb{P}(X = 2) + \mathbb{P}(X = 3) = \frac{\binom{3}{2} \cdot \binom{17}{3}}{\binom{20}{5}} + \frac{\binom{3}{3} \cdot \binom{17}{2}}{\binom{20}{5}}.$$

Solution to Exercise 6.13: We will use Poisson approximation.

(a) The probability that both partners have birthday on January 1st is $p = \frac{1}{365^2}$. If X denotes the number of married couples where this is the case, we can approximate the distribution of X by a Poisson with parameter $\lambda = 30{,}000 \cdot 365^{-2} \approx 0.2251$. Hence, $\mathbb{P}(X \geqslant 1) = 1 - \mathbb{P}(X = 0) = 1 - e^{-0.2251}$.

(b) In this case, the probability of both partners celebrating birthday in the same month is $1/12$ and therefore we approximate the distribution by a Poisson with parameter $\lambda = 30{,}000/12 = 2500$. Thus, $\mathbb{P}(X \geqslant 1) = 1 - \mathbb{P}(X = 0) = 1 - e^{-2500}$.

Solution to Exercise 6.14: Let X denote the duration (in minutes) of a call. By assumption, $X \sim \text{Pois}(\lambda)$ for some parameter $\lambda > 0$, so that the expected duration of a call is $\mathbb{E}[X] = \lambda$. In addition, we know that $\mathbb{P}(X = 2) = 3\mathbb{P}(X = 4)$, which means

$$e^{-\lambda}\frac{\lambda^2}{2!} = 3e^{-\lambda}\frac{\lambda^4}{4!}.$$

From here we deduce that $\lambda^2 = 4$ and hence $\mathbb{E}[X] = \lambda = 2$.

Part 2

Continuous random variables

CHAPTER 7

Continuous distributions

7.1. Basic theory

7.1.1. Definition, PDF, CDF. We start with the definition a continuous random variable.

Definition (Continuous random variables)

A random variable X is said to have a *continuous distribution* if there exists a non-negative function $f = f_X$ such that

$$\mathbb{P}(a \leqslant X \leqslant b) = \int_a^b f(x)dx$$

for every a and b. The function f is called the *density function* for X or the *PDF* for X.

More precisely, such an X is said to have an *absolutely continuous distribution*. Note that $\int_{-\infty}^{\infty} f(x)dx = \mathbb{P}(-\infty < X < \infty) = 1$. In particular, $\mathbb{P}(X = a) = \int_a^a f(x)dx = 0$ for every a.

Example 7.1. Suppose we are given that $f(x) = c/x^3$ for $x \geqslant 1$ and 0 otherwise. Since $\int_{-\infty}^{\infty} f(x)dx = 1$ and

$$c \int_{-\infty}^{\infty} f(x)dx = c \int_1^{\infty} \frac{1}{x^3}dx = \frac{c}{2},$$

we have $c = 2$.

PMF or PDF?

Probability mass function (PMF) and (probability) density function (PDF) are two names for the same notion in the case of discrete random variables. We say *PDF* or simply a *density function* for a general random variable, and we use *PMF* only for discrete random variables.

Definition (Cumulative distribution function (CDF))

The *distribution function* of X is defined as

$$F(y) = F_X(y) := \mathbb{P}(-\infty < X \leqslant y) = \int_{-\infty}^y f(x)dx.$$

It is also called the *cumulative distribution function* (CDF) of X.

We can define CDF for any random variable, not just continuous ones, by setting $F(y) := \mathbb{P}(X \leqslant y)$. Recall that we introduced it in Definition 5.3 for discrete random variables. In that case it is not particularly useful, although it does serve to unify discrete and continuous random variables. In the continuous case, the fundamental theorem of calculus tells us, provided f satisfies some conditions, that

$$f(y) = F'(y).$$

By analogy with the discrete case, we define the expectation of a continuous random variable.

7.1.2. Expectation, discrete approximation to continuous random variables.

Definition (Expectation)

For a continuous random variable X with the density function f we define its *expectation* by

$$\mathbb{E}X = \int_{-\infty}^{\infty} x f(x) dx$$

if this integral is absolutely convergent. In this case we call X *integrable.*

Recall that this integral is absolutely convergent if

$$\int_{-\infty}^{\infty} |x| f(x) dx < \infty.$$

In the example above,

$$\mathbb{E}X = \int_{1}^{\infty} x \frac{2}{x^3} dx = 2 \int_{1}^{\infty} x^{-2} dx = 2.$$

Later in Example 10.1 we will see that a continuous random variable with Cauchy distribution has infinite expectation.

Proposition 7.1 (Discrete approximation to continuous random variables)

Suppose X is a nonnegative continuous random variable with a finite expectation. Then there is a sequence of discrete random variables $\{X_n\}_{n=1}^{\infty}$ such that

$$\mathbb{E}X_n \xrightarrow[n \to \infty]{} \mathbb{E}X.$$

PROOF. First observe that if a continuous random variable X is nonnegative, then its density $f(x) = 0$ $x < 0$. In particular, $F(y) = 0$ for $y \leqslant 0$, thought the latter is not needed for our proof. Thus for such a random variable

$$\mathbb{E}X = \int_{0}^{\infty} x f(x) dx.$$

Suppose $n \in \mathbb{N}$, then we define $X_n(\omega)$ to be $k/2^n$ if $k/2^n \leqslant X(\omega) < (k+1)/2^n$, for $k \in \mathbb{N} \cup \{0\}$. This means that we are approximating X from below by the largest multiple of 2^{-n} that is still below the value of X. Each X_n is discrete, and X_n increase to X for each $\omega \in S$.

Consider the sequence $\{\mathbb{E}X_n\}_{n=1}^{\infty}$. This sequence is an increasing sequence of positive numbers, and therefore it has a limit, possibly infinite. We want to show that it is finite and it is equal to $\mathbb{E}X$.

We have

$$\mathbb{E}X_n = \sum_{k=1}^{\infty} \frac{k}{2^n} \mathbb{P}\left(X_n = \frac{k}{2^n}\right)$$

$$= \sum_{k=1}^{\infty} \frac{k}{2^n} \mathbb{P}\left(\frac{k}{2^n} \leqslant X < \frac{k+1}{2^n}\right)$$

$$= \sum_{k=1}^{\infty} \frac{k}{2^n} \int_{k/2^n}^{(k+1)/2^n} f(x)dx$$

$$= \sum_{k=1}^{\infty} \int_{k/2^n}^{(k+1)/2^n} \frac{k}{2^n} f(x)dx.$$

If $x \in [k/2^n, (k+1)/2^n)$, then x differs from $k/2^n$ by at most $1/2^n$, and therefore

$$0 \leqslant \int_{k/2^n}^{(k+1)/2^n} xf(x)dx - \int_{k/2^n}^{(k+1)/2^n} \frac{k}{2^n} f(x)dx$$

$$= \int_{k/2^n}^{(k+1)/2^n} \left(x - \frac{k}{2^n}\right) f(x)dx \leqslant \frac{1}{2^n} \int_{k/2^n}^{(k+1)/2^n} f(x)dx$$

Note that

$$\sum_{k=1}^{\infty} \int_{k/2^n}^{(k+1)/2^n} xf(x)dx = \int_0^{\infty} xf(x)dx$$

and

$$\sum_{k=1}^{\infty} \frac{1}{2^n} \int_{k/2^n}^{(k+1)/2^n} f(x)dx = \frac{1}{2^n} \sum_{k=1}^{\infty} \int_{k/2^n}^{(k+1)/2^n} f(x)dx = \frac{1}{2^n} \int_0^{\infty} f(x)dx = \frac{1}{2^n}.$$

Therefore

$$0 \leqslant \mathbb{E}X - \mathbb{E}X_n = \int_0^\infty xf(x)dx - \sum_{k=1}^\infty \int_{k/2^n}^{(k+1)/2^n} \frac{k}{2^n} f(x)dx$$

$$= \sum_{k=1}^\infty \int_{k/2^n}^{(k+1)/2^n} xf(x)dx - \sum_{k=1}^\infty \int_{k/2^n}^{(k+1)/2^n} \frac{k}{2^n} f(x)dx$$

$$= \sum_{k=1}^\infty \left(\int_{k/2^n}^{(k+1)/2^n} xf(x)dx - \int_{k/2^n}^{(k+1)/2^n} \frac{k}{2^n} f(x)dx \right)$$

$$\leqslant \sum_{k=1}^\infty \frac{1}{2^n} \int_{k/2^n}^{(k+1)/2^n} f(x)dx = \frac{1}{2^n} \xrightarrow[n \to 0]{} 0.$$

$\square$

We will not prove the following, but it is an interesting exercise: if X_m is *any* sequence of discrete random variables that increase up to X, then $\lim_{m \to \infty} \mathbb{E}X_m$ will have the same value $\mathbb{E}X$.

This fact is useful to show linearity, if X and Y are positive random variables with finite expectations, then we can take X_m discrete increasing up to X and Y_m discrete increasing up to Y. Then $X_m + Y_m$ is discrete and increases up to $X + Y$, so we have

$$\mathbb{E}(X + Y) = \lim_{m \to \infty} \mathbb{E}(X_m + Y_m)$$
$$= \lim_{m \to \infty} \mathbb{E}X_m + \lim_{m \to \infty} \mathbb{E}Y_m = \mathbb{E}X + \mathbb{E}Y.$$

Note that we can not easily use the approximations to X, Y and $X + Y$ we used in the previous proof to use in this argument, since $X_m + Y_m$ might not be an approximation of the same kind.

If X is not necessarily positive, we can show a similar result; we will not do the details.

Similarly to the discrete case, we have

> **Proposition 7.2**
>
> Suppose X is a continuous random variable with density f_X and g is a real-valued function, then
>
> $$\mathbb{E}g(X) = \int_{-\infty}^\infty g(x)f(x)dx$$
>
> as long as the expectation of the random variable $g(X)$ makes sense.

As in the discrete case, this allows us to define moments, and in particular the *variance*

$$\operatorname{Var} X := \mathbb{E}[X - \mathbb{E}X]^2.$$

As an example of these calculations, let us look at the uniform distribution.

> **Uniform distribution**
>
> We say that a random variable X has a *uniform distribution* on $[a, b]$ if $f_X(x) = \frac{1}{b-a}$ if $a \leqslant x \leqslant b$ and 0 otherwise.

To calculate the expectation of X

$$
\begin{aligned}
\mathbb{E}X &= \int_{-\infty}^{\infty} x f_X(x) dx = \int_a^b x \frac{1}{b-a} dx \\
&= \frac{1}{b-a} \int_a^b x \, dx \\
&= \frac{1}{b-a} \left(\frac{b^2}{2} - \frac{a^2}{2} \right) = \frac{a+b}{2}.
\end{aligned}
$$

This is what one would expect. To calculate the variance, we first calculate

$$
\mathbb{E}X^2 = \int_{-\infty}^{\infty} x^2 f_X(x) dx = \int_a^b x^2 \frac{1}{b-a} dx = \frac{a^2 + ab + b^2}{3}.
$$

We then do some algebra to obtain

$$
\operatorname{Var} X = \mathbb{E}X^2 - (\mathbb{E}X)^2 = \frac{(b-a)^2}{12}.
$$

7.2. Further examples and applications

Example 7.2. Suppose X has the following p.d.f.

$$f(x) = \begin{cases} \frac{2}{x^3} & x \geqslant 1 \\ 0 & x < 1. \end{cases}$$

Find the CDF of X, that is, find $F_X(x)$. Use the CDF to find $\mathbb{P}(3 \leqslant X \leqslant 4)$.

Solution: we have $F_X(x) = 0$ if $x \leqslant 1$ and will need to compute

$$F_X(x) = \mathbb{P}(X \leqslant x) = \int_1^x \frac{2}{y^3} dy = 1 - \frac{1}{x^2}$$

when $x \geqslant 1$. We can use this formula to find the following probability

$$\mathbb{P}(3 \leqslant X \leqslant 4) = \mathbb{P}(X \leqslant 4) - \mathbb{P}(X < 3)$$

$$= F_X(4) - F_X(3) = \left(1 - \frac{1}{4^2}\right) - \left(1 - \frac{1}{3^2}\right) = \frac{7}{144}.$$

Example 7.3. Suppose X has density

$$f_X(x) = \begin{cases} 2x & 0 \leqslant x \leqslant 1 \\ 0 & \text{otherwise} \end{cases}.$$

Find $\mathbb{E}X$.

Solution: we have that

$$\mathbb{E}[X] = \int x f_X(x) dx = \int_0^1 x \cdot 2x \, dx = \frac{2}{3}.$$

Example 7.4. The density of X is given by

$$f_X(x) = \begin{cases} \frac{1}{2} & \text{if } 0 \leqslant x \leqslant 2 \\ 0 & \text{otherwise} \end{cases}.$$

Find $\mathbb{E}\left[e^X\right]$.

Solution: using Proposition 7.2 with $g(x) = e^x$ we have

$$\mathbb{E}e^X = \int_0^2 e^x \cdot \frac{1}{2} dx = \frac{1}{2}\left(e^2 - 1\right).$$

Example 7.5. Suppose X has density

$$f(x) = \begin{cases} 2x & 0 \leqslant x \leqslant 1 \\ 0 & \text{otherwise} \end{cases}.$$

Find $\mathrm{Var}(X)$.

Solution: in Example 7.3 we found $\mathbb{E}[X] = \frac{2}{3}$. Now

$$\mathbb{E}[X^2] = \int_0^1 x^2 \cdot 2x\, dx = 2\int_0^1 x^3 dx = \frac{1}{2}.$$

Thus

$$\mathrm{Var}(X) = \frac{1}{2} - \left(\frac{2}{3}\right)^2 = \frac{1}{18}.$$

Example 7.6. Suppose X has density

$$f(x) = \begin{cases} ax + b & 0 \leqslant x \leqslant 1 \\ 0 & \text{otherwise} \end{cases}.$$

and that $\mathbb{E}[X^2] = \frac{1}{6}$. Find the values of a and b.

Solution: We need to use the fact that $\int_{-\infty}^{\infty} f(x)dx = 1$ and $\mathbb{E}[X^2] = \frac{1}{6}$. The first one gives us

$$1 = \int_0^1 (ax + b)\, dx = \frac{a}{2} + b,$$

and the second one give us

$$\frac{1}{6} = \int_0^1 x^2 (ax + b)\, dx = \frac{a}{4} + \frac{b}{3}.$$

Solving these equations gives us

$$a = -2, \text{ and } b = 2.$$

7.3. Exercises

Exercise 7.1. Let X be a random variable with probability density function

$$f(x) = \begin{cases} cx\,(5-x) & 0 \leqslant x \leqslant 5, \\ 0 & \text{otherwise.} \end{cases}$$

(A) What is the value of c?
(B) What is the cumulative distribution function of X? That is, find $F_X(x) = \mathbb{P}\,(X \leqslant x)$.
(C) Use your answer in part (b) to find $\mathbb{P}\,(2 \leqslant X \leq 3)$.
(D) What is $\mathbb{E}\,[X]$?
(E) What is $\mathrm{Var}(X)$?

Exercise 7.2. UConn students have designed the new U-phone. They have determined that the lifetime of a U-Phone is given by the random variable X (measured in hours), with probability density function

$$f(x) = \begin{cases} \frac{10}{x^2} & x \geqslant 10, \\ 0 & x \leq 10. \end{cases}$$

(A) Find the probability that the u-phone will last more than 20 hours.
(B) What is the cumulative distribution function of X? That is, find $F_X(x) = \mathbb{P}\,(X \leqslant x)$.
(C) Use part (b) to help you find $\mathbb{P}\,(X \geqslant 35)$?

Exercise 7.3. Suppose the random variable X has a density function

$$f(x) = \begin{cases} \frac{2}{x^2} & x > 2, \\ 0 & x \leqslant 2. \end{cases}$$

Compute $\mathbb{E}\,[X]$.

Exercise 7.4. An insurance company insures a large number of homes. The insured value, X, of a randomly selected home is assumed to follow a distribution with density function

$$f(x) = \begin{cases} \frac{3}{x^4} & x > 1, \\ 0 & \text{otherwise.} \end{cases}$$

Given that a randomly selected home is insured for at least 1.5, calculate the probability that it is insured for less than 2.

Exercise 7.5. The density function of X is given by

$$f(x) = \begin{cases} a + bx^2 & 0 \leqslant x \leqslant 1, \\ 0 & \text{otherwise.} \end{cases}$$

If $\mathbb{E}\,[X] = \frac{7}{10}$, find the values of a and b.

Exercise 7.6. Let X be a random variable with density function

$$f(x) = \begin{cases} \frac{1}{a-1} & 1 < x < a, \\ 0 & \text{otherwise.} \end{cases}$$

Suppose that $\mathbb{E}[X] = 6\,\mathrm{Var}(X)$. Find the value of a.

Exercise 7.7. Suppose you order a pizza from your favorite pizzeria at 7:00 pm, knowing that the time it takes for your pizza to be ready is uniformly distributed between 7:00 pm and 7:30 pm.

(A) What is the probability that you will have to wait longer than 10 minutes for your pizza?

(B) If at 7:15pm, the pizza has not yet arrived, what is the probability that you will have to wait at least an additional 10 minutes?

Exercise 7.8. The grade of deterioration X of a machine part has a continuous distribution on the interval $(0, 10)$ with probability density function $f_X(x)$, where $f_X(x)$ is proportional to $\frac{x}{5}$ on the interval. The reparation costs of this part are modeled by a random variable Y that is given by $Y = 3X^2$. Compute the expected cost of reparation of the machine part.

Exercise 7.9. A bus arrives at some (random) time uniformly distributed between $10 : 00$ and $10 : 20$, and you arrive at a bus stop at $10 : 05$.

(A) What is the probability that you have to wait at least 5 minutes until the bus comes?

(B) What is the probability that you have to wait at least 5 minutes, given that when you arrive today to the station the bus was not there yet (you are lucky today)?

Exercise* 7.1. For a continuous random variable X with finite first and second moments prove that

$$\mathbb{E}(aX + b) = a\mathbb{E}X + b,$$
$$\mathrm{Var}(aX + b) = a^2\,\mathrm{Var}\,X.$$

for any $a, b \in \mathbb{R}$.

Exercise* 7.2. Let X be a continuous random variable with probability density function

$$f_X(x) = \frac{1}{4}xe^{-\frac{x}{2}}\mathbb{1}_{[0,\infty)}(x),$$

where the indicator function is defined as

$$\mathbb{1}_{[0,\infty)}(x) = \begin{cases} 1, & 0 \leqslant x < \infty; \\ 0, & \text{otherwise.} \end{cases}$$

Check that f_X is a valid probability density function, and find $\mathbb{E}(X)$ if it exists.

Exercise* 7.3. Let X be a continuous random variable with probability density function
$$f_X(x) = \frac{4\ln x}{x^3} \mathbb{1}_{[1,\infty)}(x),$$
where the indicator function is defined as

$$\mathbb{1}_{[1,\infty)}(x) = \begin{cases} 1, & 1 \leqslant x < \infty; \\ \\ 0, & \text{otherwise.} \end{cases}$$

Check that f_X is a valid probability density function, and find $\mathbb{E}(X)$ if it exists.

7.4. Selected solutions

Solution to Exercise 7.1(A): We must have that $\int_{-\infty}^{\infty} f(x)dx = 1$, thus

$$1 = \int_0^5 cx(5-x)dx = \left[c\left(\frac{5x^2}{2} - \frac{x^3}{3}\right)\right]_0^5$$

and so we must have that $c = 6/125$.

Solution to Exercise 7.1(B): We have that

$$F_X(x) = \mathbb{P}\left(X \leqslant x\right) = \int_{-\infty}^x f(y)dy$$

$$= \int_0^x \frac{6}{125}y\left(5-y\right)dx = \frac{6}{125}\left[\left(\frac{5y^2}{2} - \frac{y^3}{3}\right)\right]_0^x$$

$$= \frac{6}{125}\left(\frac{5x^2}{2} - \frac{x^3}{3}\right).$$

Solution to Exercise 7.1(C): We have

$$\mathbb{P}\left(2 \leqslant X \leqslant 3\right) = \mathbb{P}\left(X \leqslant 3\right) - \mathbb{P}\left(X < 2\right)$$

$$= \frac{6}{125}\left(\frac{5 \cdot 3^2}{2} - \frac{3^3}{3}\right) - \frac{6}{125}\left(\frac{5 \cdot 2^2}{2} - \frac{2^3}{3}\right)$$

$$= 0.296.$$

Solution to Exercise 7.1(D): we have

$$\mathbb{E}\left[X\right] = \int_{-\infty}^{\infty} xf_X(x)dx = \int_0^5 x \cdot \frac{6}{125}x(5-x)dx$$

$$= 2.5.$$

Solution to Exercise 7.1(E): We need to first compute

$$\mathbb{E}\left[X^2\right] = \int_{-\infty}^{\infty} x^2 f_X(x)dx = \int_0^5 x^2 \cdot \frac{6}{125}x(5-x)dx$$

$$= 7.5.$$

Then

$$\mathrm{Var}(X) = \mathbb{E}\left[X^2\right] - \left(\mathbb{E}\left[X\right]\right)^2 = 7.5 - \left(2.5\right)^2 = 1.25.$$

Solution to Exercise 7.2(A): We have

$$\int_{20}^{\infty} \frac{10}{x^2}dx = \frac{1}{2}.$$

Solution to Exercise 7.2(B): We have

$$F(x) = \mathbb{P}(X \leqslant x) = \int_{10}^x \frac{10}{y^2}dy = 1 - \frac{10}{x}$$

for $x > 10$, and $F(x) = 0$ for $x < 10$.

Solution to Exercise 7.2(C): We have

$$\mathbb{P}\left(X \geqslant 35\right) = 1 - \mathbb{P}\left(X < 35\right) = 1 - F_X(35)$$

$$= 1 - \left(1 - \frac{10}{35}\right) = \frac{10}{35}.$$

Solution to Exercise 7.3: $+\infty$

Solution to Exercise 7.4: $\frac{37}{64}$.

Solution to Exercise 7.5: we need to use the fact that $\int_{-\infty}^{\infty} f(x)dx = 1$ and $\mathbb{E}\left[X\right] = \frac{7}{10}$. The first one gives us

$$1 = \int_0^1 \left(a + bx^2\right) dx = a + \frac{b}{3}$$

and the second one gives

$$\frac{7}{10} = \int_0^1 x \left(a + bx^2\right) dx = \frac{a}{2} + \frac{b}{4}.$$

Solving these equations gives

$$a = \frac{1}{5}, \text{ and } b = \frac{12}{5}.$$

Solution to Exercise 7.6: Note that

$$\mathbb{E}X = \int_1^a \frac{x}{a-1} dx = \frac{1}{2}a + \frac{1}{2}.$$

Also

$$\mathrm{Var}(X) = \mathbb{E}X^2 - \left(\mathbb{E}X\right)^2$$

then we need

$$\mathbb{E}X^2 = \int_1^a \frac{x^2}{a-1} dx = \frac{1}{3}a^2 + \frac{1}{3}a + \frac{1}{3}.$$

Then

$$\mathrm{Var}(X) = \left(\frac{1}{3}a^2 + \frac{1}{3}a + \frac{1}{3}\right) - \left(\frac{1}{2}a + \frac{1}{2}\right)^2$$

$$= \frac{1}{12}a^2 - \frac{1}{6}a + \frac{1}{12}.$$

Then, using $\mathbb{E}\left[X\right] = 6\,\mathrm{Var}(X)$, we simplify and get $\frac{1}{2}a^2 - \frac{3}{2}a = 0$, which gives us $a = 3$.

Another way to solve this problem is to note that, for the uniform distribution on $[a, b]$, the mean is $\frac{a+b}{2}$ and the variance is $\frac{(a-b)^2}{12}$. This gives us an equation $6\frac{(a-1)^2}{12} = \frac{a+1}{2}$. Hence $(a-1)^2 = a + 1$, which implies $a = 3$.

Solution to Exercise 7.7(A): Note that X is uniformly distributed over $(0, 30)$. Then

$$\mathbb{P}(X > 10) = \frac{2}{3}.$$

Solution to Exercise 7.7(B): Note that X is uniformly distributed over $(0, 30)$. Then

$$\mathbb{P}(X > 25 \mid X > 15) = \frac{\mathbb{P}\left(X > 25\right)}{\mathbb{P}(X > 15)} = \frac{5/30}{15/30} = 1/3.$$

Solution to Exercise 7.8: First of all we need to find the PDF of X. So far we know that
$$f(x) = \begin{cases} \frac{cx}{5} & 0 \leqslant x \leqslant 10, \\ 0 & \text{otherwise.} \end{cases}$$
Since
$$\int_0^{10} c\frac{x}{5}dx = 10c,$$
we have $c = \frac{1}{10}$. Now, applying Proposition 7.2 we get
$$\mathbb{E}Y = \int_0^{10} \frac{3}{50}x^3 dx = 150.$$

Solution to Exercise 7.9(A): The probability that you have to wait at least 5 minutes until the bus comes is $\frac{1}{2}$. Note that with probability $\frac{1}{4}$ you have to wait less than 5 minutes, and with probability $\frac{1}{4}$ you already missed the bus.

Solution to Exercise 7.9(B): The conditional probability is $\frac{2}{3}$.
